

What Is Claimed Is:

1. A cassette device for accepting substrates, comprising:
 - a frame;
 - a plurality of slots protruding from opposing sides of the frame; and
 - at least two supporting bars connected to at least two of the slots.
2. The device according to claim 1, wherein the supporting bars include acetal resin material.
3. The device according to claim 1, wherein the supporting bars contact the substrate via surface contact.
4. The device according to claim 3, wherein the substrates include a first substrate having a plurality of thin film transistor arrays and a second substrate having a plurality of color filters such that the first and second substrates are bonded together.

5. The device according to claim 4, further comprising a liquid crystal layer between the first and second substrates.
6. The device according to claim 5, wherein the liquid crystal layer is applied to at least one of the first substrate and the second substrate.
7. The device according to claim 4, further comprising a plurality of spacers provided between the first and second substrates.
8. The device according to claim 7, wherein the spacers include patterned spacers.
9. The device according to claim 3, wherein the substrate are transferred onto the supporting bars by a robot arm.
